Building A Better Bulletin

by Emelia Goldschmidt, Moxie Bohlen, Sylvia Riggs

Section I: Explain you're hoping to accomplish, addressing all the points below, if applicable:

1. What problem are you trying to solve? Why is the project interesting to you?

The school's bulletin is presented in a way that is unintuitive, decentralized, and redundant. Important information can be split between the school's Coursedog bulletin and Coursicle. There are sorts for things you can't filter courses for, and it is an overall unpleasant experience to be planning a course schedule with the current databases.

2. Provide original diagrams and figures to help you explain your application.

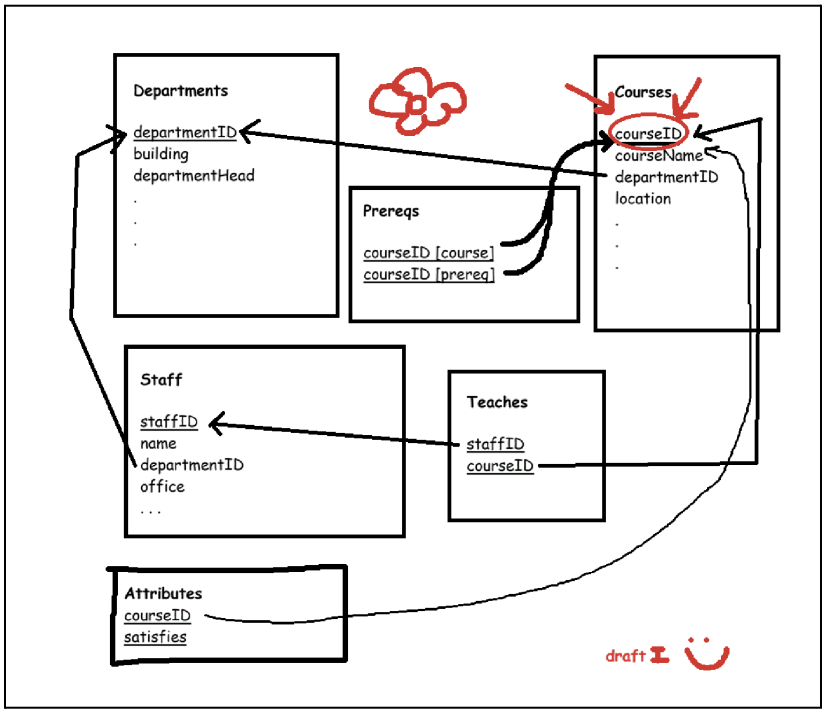

Figure 1

Address the novelty of the project. Explain what this project will teach you beyond what you'll take away from this course.

This project may involve the use of a handmade webscraper and a searchable frontend on a localhost server.

List the expected challenges. How do you expect the project will push you and your team? In what areas do you expect to face challenges? (The challenges may not be technical.)

Getting this data is going to be quite challenging. If there was any way we could get ahold of this current database, as it exists (that's not the export as csv option (this does not even satisfy 1NF, nor does it include course codes)), that would be a tremendous help. This is our initial concern, and we are trying not to think about problems further down the line.

Section II: Tentative Grading Rubric

How do you measure the success of your project? This also gives you a chance to think a little bit more about the details of the project. Work with your team and distribute 100 points across different item. You can model your rubric off of the ones I give you for your assignments. This rubric is only tentative, because we might expect plans to change as time passes. I will be using the finalized version to assign a final grade to your project.

[5pts] A schema with primary keys foreign keys have been defined for SQLite.

[30pts] Getting the data into the database

[60pts] Fully searchable

[5pts] Secure, search is sanitized

We are very open to feedback on all aspects of this project.
